

SINA Mobile

The smartphone turns into a client

Today, working on the move is an essential part of our everyday lives. The desire for smaller, more manageable and lighter devices that can reproduce the full range of functions of a PC is growing. SINA Mobile does not only offer a wide range of functions and applications, but also the highest level of security: Approval for German national RESTRICTED (VS-NfD) classification is being sought from the German Federal Office for Information Security (BSI).

Wide selection of hardware

SINA Mobile is an application suite that can be run on all SAMSUNG Knox Enterprise devices with Android operating system. This creates flexibility while maintaining the familiar graphical user interface.

Secure access to the corporate network

An integrated VPN module in the app allows the user to conveniently connect to the company's SINA infrastructure. When the VPN is switched off, the open Internet remains accessible and private apps from the Google Play Store can be used without restrictions.

High-performance streaming client

A viewer on the smartphone allows data up to German national RESTRICTED (VS-NfD) classification to be processed securely. The streaming client relocates high-performance applications to the secure Cloud. This means that no classified documents, files or messages are stored on the device itself.

Integrated security anchor

SINA Mobile offers user-friendly two-factor authentication. All security features are mapped to a hardware security anchor. Together with a PIN, it forms the cryptographic key of the system.

Desktop mode

It is possible to connect the smartphone to a monitor. With a mouse and keyboard, one gets a highly mobile, secure and modern workstation – and new ways to work:

Photos taken with a smartphone can be conveniently edited on the workstation. Documents can be created on the workstation and then conveniently signed by touch input on the smartphone.

Central MDM

SINA Mobile is managed via the SINA Management software. This ensures mass roll-outs, remote updates and configuration via the corporate network, and the smartphone integrates seamlessly into the SINA infrastructure.

Benefits

- High hardware flexibility and familiar working environment
- Private apps can still be used
- Secure compartmentalization of German national RESTRICTED (VS-NfD) data through streaming client with VPN connection
- First smartphone in its security class with a desktop mode for limitless working
- Seamless connection to an existing SINA infrastructure
- Approval according to German national RESTRICTED (VS-NfD) classification underway
